

The logo for Bulk Proxy Forge is centered on a black background. It features the words "Bulk Proxy" in a large, stylized, metallic font with a glowing orange and yellow border. Below "Proxy" is the word "Forge" in a smaller, simpler, glowing orange font. The background of the logo is a textured, brownish-orange surface with some dark, jagged shapes at the bottom.

Bulk Proxy Forge

The manual proxy workflow got out of hand

Over the last couple of weeks, I built a large batch of custom MTG proxies.

Original printing

What I wanted to make

~500
cards prepared

300+
custom art images

10–20h
frame + card setup

2–5h
final print packaging

The slow part was not creativity — it was repetitive setup, matching, exporting, renaming, and organizing.

Large proxy projects are fragmented and repetitive

Creating large batches of custom MTG proxies requires several disconnected tools and a large amount of repetitive manual work to turn existing decklists and artwork into correctly formatted, print-ready cards.

The core problem is not one hard task. It is hundreds of small manual steps repeated across every card.

PROBLEM 1

Deck data should not be rebuilt by hand

PROBLEM

I already made my decks in Scryfall.
I should not have to recreate every
card manually or lose the exact
printing I selected.

SOLUTION

Paste a Scryfall deck link. Bulk
Proxy Forge pulls exact card data —
selected art, artist, rules text, set,
collector number, and metadata —
not just the card name.

Scryfall deck link → exact card records

PROBLEM 2

Turning card data into finished images is the real time sink

PROBLEM

Card creation tools are powerful, but configuring frames, text boxes, sizing, and special card layouts for hundreds of cards takes hours.

SOLUTION

Bulk Proxy Forge applies reusable templates and automatically fills them with imported card data, generating finished proxy images in bulk.

PROBLEM 3

One card back is not enough

I want different art sources, set symbols, templates, and card backs for different groups of cards.

Bulk Proxy Forge groups cards by deck so each deck can carry its own setup — including its own custom back.

five example deck-specific backs

Deck A ≠ Deck B ≠ Deck C

PROBLEM 4

The printer order expects exact front/back pairing

Printing services can accept a ZIP, but every front image must match the correct back image with the same number.

Bulk Proxy Forge automatically builds the correctly formatted ZIP and prepares the order for upload.

Manual matching: 2–5 hours
Automated packaging: minutes

CONCLUSION

Bulk Proxy Forge streamlines the whole process

A 15–25 hour manual workflow becomes about 5 minutes of user decisions plus automated processing.

Next goal: make the same workflow fully web-based so users do not have to manually download, rename, or re-upload files.
